

CCNA 200-301 - Dynamic NAT & PAT Summary

Overview

Dynamic NAT uses a pool of Public IP addresses. PAT (Overload) allows multiple devices to share one Public IP using different source ports.

Dynamic NAT Commands

```
access-list 1 permit 192.168.1.0 0.0.0.255 : Select inside network.  
ip nat pool aa 10.0.0.1 10.0.0.4 netmask 255.255.255.0 : Create Public IP pool.  
ip nat inside source list 1 pool aa : Bind ACL to pool.  
interface fa0/0 + ip nat inside : Mark LAN interface.  
interface fa0/1 + ip nat outside : Mark Internet interface.
```

PAT

```
ip nat inside source list 1 pool aa overload
```

The keyword overload enables many devices to use one Public IP.

Verification

```
show ip nat translations : Current translations.  
show ip nat statistics : NAT statistics.  
show access-lists : ACL entries.  
show ip route : Routing table.
```

Troubleshooting

Check ACL, NAT Pool, inside/outside interfaces, default route or OSPF, and verify basic connectivity before testing NAT.
